

Tria Contact List Application

This is a simplified contact list application built with React, as per the Tria frontend assignment.

Live Demo

[Your Vercel Deployment URL Here] (e.g., <https://my-contact-list-abcde.vercel.app/>)

Features

- **View Contacts:** Displays a list of contacts with their name, email, and phone number.
- **Search Contacts:** Allows searching contacts by name using a search bar. The list updates in real-time as you type.
- **Add New Contact (Optional):** Provides a form to add new contacts to the list. (Implemented)

Technical Stack

- **Framework:** React (using Vite for bundling)
- **State Management:** React's `useState` and `useEffect` hooks.
- **API Interaction:** Mimics an asynchronous API call using JavaScript `Promise` and `setTimeout` for fetching and adding contacts. Data is hardcoded in `src/api/contacts.js`.
- **Styling:** Pure CSS (module-based for components).
